

EXPERIMENT – 5

AIM

To implement form validation using JavaScript along with an activity-based timer that resets on user activity and automatically logs out the user after a specified period of inactivity.

DESCRIPTION

This experiment demonstrates form validation and JavaScript event handling. The application validates the login form and monitors user activities such as **mousemove**, **keydown**, **keyup**, **click**, **drag**, and **scroll**. The inactivity timer is reset whenever the user performs any of these activities. If no activity occurs for the specified time, the user is automatically logged out and redirected to the login page.

```

DETAILS ABOUT PROGRAM

Folder structure:

FullStack/

```
└── Week-5/  
    ├── background.jpg  
    ├── logo.jpeg  
    ├── login.html  
    ├── success.html  
    ├── style.css  
    └── script.js
```

The program is executed in a **web browser** by opening login.html.

Execution steps:

1. Open the Form-Validation folder in VS Code.
2. Open login.html in a web browser.
3. Enter the required login details.
4. Perform activities such as mouse movement, keyboard actions, clicking, dragging, or scrolling.
5. The timer resets whenever activity is detected.
6. Stop all activities and wait for the specified inactivity period.
7. The user is automatically logged out and redirected to the login page.

OUTPUT

The form is validated successfully, the inactivity timer resets on user activity, and the user is automatically logged out and redirected to the login page after the specified period of inactivity.
